Thumbnail:

Thumbnail designed in After Effects

Song source(s) (In order):

1. Mattia Cupelli: Epic Powerful Emotional Music | The Phoenix (Download and Royalty FREE) - https://www.youtube.com/watch?v=b6MS-lqIUcA

2. Ross Bugden - Music: Emotional and Dramatic Music - Reverie (Copyright and Royalty Free) - https://www.youtube.com/watch?v=CZ72Z9S305I

3. Savfk - Music: Odyssey by Savfk (copyright and royalty free dramatic, orchestral, intense, epic soundtrack music) - https://www.youtube.com/watch?v=XF8mFWPilPg

4. Lionel Schmitt: Epic Music - 1000 Ships Against The Wind (Big Orchestral Fantasy With Choir) - https://soundcloud.com/lionel-schmitt/epic-music-1000-ships-against-the-wind

Objects with image and video source(s) in order:

1. **Planck Length** – 1.616 x 10^-35 meters: The shortest possible unit of length that can be theoretically measured
   Source: Planck length designed in After Effects

2. **String** - 1.616 x 10^-35 m: A fundamental part of string theory
   Source: String designed in After Effects

3. **Calabi Yau Manifold** - 1.616 x 10^-35 m: A Planck scale manifold
   Source: (https://commons.wikimedia.org/wiki/File:Quintic_1.png) Transferred from de.wikipedia to Commons by Trockennasenaffe using CommonsHelper. - The original uploader was Floriang at German Wikipedia

4. **Quantum Foam** - 1.616 x 10^-35 m: A proposed model of virtual particles and antiparticles annihilating each other
   Source: Quantum foam designed in After Effects

5. **Planck Particle** – 1.14 x 10^-34 m: Due to its size, it would only exist for 5 x 10^-39 seconds
   Source: Planck particle designed in After Effects

6. **1 MeV neutrino** – 4 x 10^-23 m: The neutrino was first discovered at the Savannah River Site, a nuclear reservation
   Source: 1 MeV neutrino designed in After Effects

7. **High energy neutrino** – 1.4 x 10^-20 m: Neutrino astronomy is a growing area dedicated to the detection of these neutrinos from high energy events
   Source: High energy neutrino designed in After Effects

8. **Cosmic Ray** - 1.2 × 10^-19 m: Wavelength needed to produce an air shower that reaches the ground
   Source: Cosmic ray designed in After Effects

9. **Upper size limit of a quark** – 1 x 10^-18 m: Quarks make up hadrons, which are particles such as protons and neutrons
   Source: Upper size limit of a quark designed in After Effects

10. **100 GeV cosmic ray** - 1.2 × 10^-17 m: The minimum energy needed to detect cosmic rays is above this energy limit
    Source: 100 GeV cosmic ray designed in After Effects

11. **Neutron** – 1.6 x 10^-15 m: A nucleon with no total charge
    Source: Neutron designed in After Effects

12. **Proton** – 1.68 x 10^-15 m: A nucleon with a positive charge
    Source: Proton designed in After Effects

13. **Fluorine** – 8.4 x 10^-11 m (84 picometers): Among the elements it is the most electronegative, it is also a very toxic elemental gas
    Source: Fluorine designed in After Effects

14. **X-ray Crystallography beam** – 1 x 10^-10 m (100 picometers): An X-ray beam of this length is optimal to use to determine the structure of proteins
    Source: X-ray crystallography beam designed in After Effects

15. **Argon** – 1.42 x 10^-10 m (142 picometers): An unreactive element used as a shielding gas, a dating element, in lights and much more
    Source: Argon designed in After Effects

16. **Osmium** – 3.7 x 10^-10 m (370 picometers): Osmium is the densest known element and has a high melting point over 3,000 degrees Celsius
    Source: Osmium designed in After Effects

17. **Barium** – 5.06 x 10^-10 m (506 picometers): Barium can add a green color to fireworks and tracer ammunition
    Source: Barium designed in After Effects

18. **Buckyball** – 7 x 10^-10 m (700 picometers): Made of 60 carbon atoms, it was discovered when soot from laser vaporization was examined

Source: https://commons.wikimedia.org/wiki/File:Buckminsterfullerene-3D-balls.png - Jynto (talk) (This chemical image was created with Discovery Studio Visualizer.)

19. **Carbon nanotube** – 1 x 10^-9 m (1 nanometers): Different types of nanotubes can also be created, such as boron nitride nanotubes
Source: https://commons.wikimedia.org/wiki/File:Carbon_nanotube_(8,8)_3D_spacefill.png - Jynto (talk) (This chemical image was created with Discovery Studio Visualizer.)

20. **Cowpea mosaic virus** – 2.8 x 10^-8 m (28 nanometers): Its capsid can be modified easily, making it potentially useful for nanoscale tasks such as electronics and biosensors
Source: https://commons.wikimedia.org/wiki/File:CowpeaMosaicVirus3D.png - Thomas Splettstoesser (www.scistyle.com)

21. **Norovirus** – 4 x 10^-8 m (40 nanometers): The virus responsible for gastroenteritis, which kills over 200,000 people every year
Source: https://phil.cdc.gov/details.aspx?pid=21350 - CDC / Jessica A. Allen, Illustrator: Alissa Eckert, MS

22. **Bacteriophage T4** – 2 x 10^-7 m (200 nanometers): A phage virus which targets E-Coli for infection and replication
Source: https://commons.wikimedia.org/wiki/File:T4_rendered.jpg - Oona Räisänen

23. **Molluscum contagiousum virus** – 3.2 x 10^-7 m (320 nanometers): This virus causes irritating lesions called water warts
Source: https://commons.wikimedia.org/wiki/File:Molluscum_contagiousum_virus.jpg - User:Graham Beards

24. **Lysosome** – 5.5 x10^-7m (0.55 micrometers): An organelle with a primary function of breaking down various kinds of compounds within cells
Source: https://www.flickr.com/photos/internetarchivebookimages/19756543133/
Source book page:
https://archive.org/stream/biologicalbullet151mari/#page/n475/mode/1up - Marine Biological Laboratory (Woods Hole, Mass.); Marine Biological Laboratory (Woods Hole, Mass.). Annual report 1907/08-1952; Lillie, Frank Rattray, 1870-1947; Moore, Carl Richard, 1892-; Redfield, Alfred Clarence, 1890-1983

25. **Campylobacter jejuni** – 4 x 10^-6 m (4 micrometers): It is among the most common cause for infection and food poisoning in the USA and Europe
Source: Agricultural Research Service (ARS) is the U.S. Department of Agriculture's chief scientific research agency.
(https://commons.wikimedia.org/wiki/File:ARS_Campylobacter_jejuni.jpg) - De Wood, Pooley, USDA, ARS, EMU.

26. **Eosinophil** – 1.7 x 10^-5 m (17 micrometers): A type of white blood cell known as a Granulocyte which can kill parasites by flooding in huge numbers around them
    Source: https://commons.wikimedia.org/wiki/File:Eosinophil_and_polymorphonuclear_neutrophil.jpg - Davidcsaba Dr. David Csaba L.

27. **Hepatocyte** – 3 x 10^-5 m (30 micrometers): The primary cells of the liver with its roles including detoxification and bile formation
    Source: https://commons.wikimedia.org/wiki/File:Ground_glass_hepatocytes_high_mag.jpg - Nephron

28. **Paramecium** – 3.3 x 10^-4 m, (0.33mm): A genus of ciliates with studies suggesting the possibility of training and learning through cell memory
    Source: Originally uploaded to the English Wikipedia, where it was made by Barfooz. (https://commons.wikimedia.org/wiki/File:Paramecium.jpg) - Barfooz at the English Wikipedia.

29. **Thiomargarita namibiensis** – 7.7 x 10^-4m (0.75mm): The largest species of bacteria found to date
    Source: Thiomargarita namibiensis designed in After Effects

30. **Pelomyxa Palustris** – 5 x 10^-3 m (5mm): Over time they have lost multiple organelles that their descendants used to possess, such as mitochondria
    Source: This document was created as part of the Pénard project (https://commons.wikimedia.org/wiki/File:Collection_Penard_MHNG_Specimen_547-2-2_Pelomyxa_palustris.tif) - Dalinda Bouraoui

31. **Sechellophryne gardineri** – 1.1 x 10^-2 m (1.1cm): An extremely small species of frog that uses its mouth to help with its hearing
    Source: https://commons.wikimedia.org/wiki/File:Sechellophryne_gardineri.jpg - Evan Pickett

32. **Bee hummingbird** – 5.5 x 10^-2 m (5.5cm): The smallest birds in the world, with males slightly smaller than the females
    Source: Own work, from Sharp Photography, sharpphotography (https://commons.wikimedia.org/wiki/File:Bee_hummingbird_(Mellisuga_helenae)_adult_male_non-breeding.jpg) - Charlesjsharp

33. **Dragon fruit** – 1 x 10^-1 m (10cm): A type of cactus fruit with the white fleshed variety being the most common type
    Source: https://commons.wikimedia.org/wiki/File:Pitaya_cross_section_ed2.jpg - SMasters

34. **Fire salamander** – 1.5 x 10^-1 m (15 cm): Found all around Europe, some members can live for over 50 years
    Source: https://commons.wikimedia.org/wiki/File:Feuersalamander_080223-1.jpg - Aconcagua

35. **Cake** – 2 x 10^-1 m (20 cm): There are roughly 25 servings in a 20-centimeter cake
    Source: https://www.flickr.com/photos/15442697@N06/3151782513/ - **Shadow Byrd**

36. **Common housecat** – 2.5 x 10^{-1} m (25 cm): First domesticated around 9,000 years ago
    Source: Cat photograph taken by myself

37. **Polar bear**- 1.33 meters: A giant mammalian predator which is capable of swimming for days and can smell prey up to 1.6 kilometers away
    Source:
    https://commons.wikimedia.org/wiki/File:Polar_bear_after_unlucky_hunt_for_a_seal.jpg - Andreas Weith

38. **Human** – 1.72 meters: An average human may contain around 100 trillion cells
    Source:

39. **Great White Shark** – 6.1 meters: Found all over the world, one has been observed travelling up to 20,000 kilometers within nine months
    Source: https://www.flickr.com/photos/elevy/14730723649/ -
    Elias Levy

40. **Orca** – 8 meters: Apex predators with some in groups called pods, traits and hunting methods are passed on in these pods
    Source: https://commons.wikimedia.org/wiki/File:JumpingOrca.jpg -
    Mlewan

41. **Humpback whale** – 19 meters: A species of whale known to play with, sing to and protect other aquatic species of whales and dolphins
    Source: https://www.flickr.com/photos/87895263@N06/16632738580/ - **Sylke Rohrlach**

42. **Blue Whale** – 29.9 meters: The largest animal to have existed, it weighs up to 173 tons
    Source: Protected Resouces Division, Southwest Fisheries Science Center, La Jolla, California (https://commons.wikimedia.org/wiki/File:Blue_Whale_001_body_bw.jpg) - NOAA Fisheries (TBjornstad 11:17, 18 April 2007 (UTC))

43. **Airbus A380** - 79.75 meters: It is the largest passenger aircraft in service
    Source: https://www.flickr.com/photos/medau/13188435175/ - **Joao Carlos Medau**

44. **BFR** – 106 meters: A hypothetical rocket designed with the goal of reach Mars in the next decade
    Source: https://commons.wikimedia.org/wiki/File:BFR.svg - Raisoman

45. **Oumuamua** – 180 meters: The first interstellar object found passing through the solar system, its shape is extremely elongated
    Source: Oumuamua designed in Blender

46. **Titanic** – 269 meters: A ocean liner which hit an ice berg in 1912, causing the deaths of 1,500 people
    Source: Cobh Heritage Centre, museum in Cobh, Ireland, http://www.cobhheritage.com/welcome/cobh-heritage-centre/ (https://commons.wikimedia.org/wiki/File:Titanic-Cobh-Harbour-1912.JPG) - Unknown photographer, photo taken on April 11, 1912

47. **Pioneering Spirit** – 382 meters: A construction vessel, it is world's largest vessel
    Source: https://www.flickr.com/photos/28169156@N03/28811029965/ - **Frans Berkelaar**

48. **Burj Khalifa** – 828 meters: Designed in a neo-futuristic architecture style, it is the tallest man-made structure on Earth
    Source:

49. **Shiprock** – 2,188 meters: The eroded remains of a long-gone volcano in New Mexico
    Source: https://www.flickr.com/photos/bowiesnodgrass/319948324/ - **bowie snodgrass**

50. **Methone** – 3,880 meters: This Saturnian moon is one of the least dense objects in the solar system
    Source: http://www.ciclops.org/view/7280/Gray_Egg - NASA / JPL-Caltech / Space Science Institute

51. **PSR B0943+10**: 5,200 meters: A pulsar that could be a quark star, an exotic star made of free quarks
    Source: PSR B0943+10 designed in After Effects

52. **Cotopaxi** – 5,897 meters: A very active volcano in Ecuador with over 50 eruptions since 1738
    Source: https://commons.wikimedia.org/wiki/File:Cotopaxi_with_horse.jpg - Simon Matzinger

53. **Makalu** – 8,485 meters: The fifth highest mountain on Earth, it is shaped like a gigantic pyramid
    Source: https://www.panoramio.com/photo/113940328 - Hiroki Ogawa

54. **Lhotse** – 8,516 meters: The first summit of the fourth highest mountain was made by Ernst Reiss and Fritz Luchsinger in 1956
    Source: https://commons.wikimedia.org/wiki/File:Lhotse-fromChukhungRi.jpg - Uwe Gille

55. **Kangchenjunga** – 8,586 meters: The highest mountain in India, a local myth tells that the Kangchenjunga Demon inhabits its slopes
    Source: https://commons.wikimedia.org/wiki/File:Kangchenjunga.JPG - Siegmund Stiehler

56. **K2** – 8,611 meters: The second mountain, one in four who climb it will not survive
    Source: https://commons.wikimedia.org/wiki/File:K2_2006b.jpg - Svy123

57. **Mount Everest** - 8,848 meters: The highest mountain on Earth
    Source: https://commons.wikimedia.org/wiki/File:Mt._Everest_from_Gokyo_Ri_November_5,_2012.jpg - Rdevany

58. **Deimos** – 15 kilometers: Mars's smaller moon, it is smoother than Deimos and smaller
    Source: https://hirise.lpl.arizona.edu/deimos.php (http://hirise.lpl.arizona.edu/images/2009/deimos/ESP_012068_9000_COLOR5.tif) - NASA/JPL/University of Arizona

59. **Lich** – 20 kilometers: A pulsar weighing 1.4 times as much as the Sun with a planetary system
    Source: Lich designed in After Effects

60. **Liechtenstein** – 24 kilometers: It has a literacy rate of 100% and an unemployment rate of 1.5%
    Source: https://commons.wikimedia.org/wiki/File:Liechtenstein-Planken.svg - Jon Harald Søby

61. **PSR J0348+0432** – 26 kilometers: This pulsar is extremely heavy, at 2 solar masses, it orbits a much lighter white dwarf
    Source: PSR J0348+0432 designed in After Effects

62. **Pan** – 34.4 kilometers: The closest moon of Saturn's; it is walnut shaped
    Source: https://saturn.jpl.nasa.gov/news/3005/cassini-reveals-strange-shape-of-saturns-moon-pan/ - NASA/JPL-Caltech/Space Science Institute

63. **Atlas** – 40.8 kilometers: It has accumulated so much dust that any more that impacts the moon flies back off into space due to centrifugal force
    Source: NASA/JPL-Caltech/Space Science Institute - NASA/JPL-Caltech/Space Science Institute

64. **Cygnus X-1** – 44 kilometers: A black hole that produces one the strongest observed X-ray sources in the galaxy
    Source: Cygnus X-1 designed in After Effects

65. **Nix** – 50 kilometers: A moon of Pluto that tumbles chaotically
    Source: http://www.nasa.gov/feature/last-of-pluto-s-moons-mysterious-kerberos-revealed-by-new-horizons
    (https://commons.wikimedia.org/wiki/File:Nix_(moon)_in_color.jpg) - NASA-JHUAPL-SWRI (colored by PlanetUser using Adobe Photoshop CS5)

66. **Epimetheus** – 129.8 kilometers: This Saturnian moon is likely to be rich in water ice
    Source: http://photojournal.jpl.nasa.gov/jpeg/PIA17208.jpg - NASA/JPL-Caltech/Space Science Institute

67. **Janus** – 203 kilometers: It is co-orbital with Epimetheus, meaning it shares almost the same orbit
    Source: http://www.ciclops.org/view/6413/Blasted_Janus,
    http://photojournal.jpl.nasa.gov/catalog/PIA12714 - NASA / Jet Propulsion Laboratory / Space Science Institute

68. **Hyperion** – 360.2 kilometers: A possible segment of a larger moon destroyed long ago
    Source: Transferred from en.wikipedia to Commons. NASA Posting at http://solarsystem.nasa.gov/multimedia/display.cfm?IM_ID=4143. (The original uploader was Tablizer at English Wikipedia Later versions were uploaded by Clh288 at en.wikipedia.) - NASA/JPL/Space Science Institute

69. **Mimas** – 415.6 kilometers: The smallest known moon to be rounded by its own gravity
    Source:
    http://www.nasa.gov/mission_pages/cassini/multimedia/pia12570.html
    http://photojournal.jpl.nasa.gov/catalog/PIA12570 - NASA / JPL-Caltech / Space Science Institute

70. **Miranda** – 480 kilometers: With relatively young features on its surface, it may be geologically active
    Source: Keele Astrophysics Group;
    Photojournal
    NASA Secondary Sources: PIA01490 (rotate to the right 90 degrees and enhance details), PIA 00042 and PIA 02217
    http://photojournal.jpl.nasa.gov/catalog/PIA18185 - NASA/JPL-Caltech

71. **Ceres** – 965.2 kilometers: A minor planet and the asteroid belts largest object
    Source: https://www.flickr.com/photos/132160802@N06/22381131691/ - NASA / JPL-Caltech / UCLA / MPS / DLR / IDA / Justin Cowart (**Justin Cowart**)

72. **Charon** – 1,212 kilometers: The largest moon of Pluto, it is mutually tidally locked with Pluto
    Source: Charon texture from: https://snowfall-the-cat.deviantart.com/art/Charon-Map-2015-Nov-07-546620055?offset=50#comments - **Snowfall-The-Cat**

73. **Iapetus** – 1,492 kilometers: A giant equatorial ridge can is present at the equator, with peaks as high as 20 kilometers
    Source: http://photojournal.jpl.nasa.gov/jpeg/PIA18436.jpg - NASA/JPL-Caltech/Space Science Institute/Lunar and Planetary Institute

74. **MakeMake** – 1,500 kilometers: Methane grains up to one centimeter in size are present on the surface of MakeMake
    Source: Makemake texture: https://www.solarsystemscope.com/textures - Solar System Scope

75. **Pluto** – 2,376 kilometers: Mountains made of water ice several kilometers high was found in the Sputnik Planitia region
    Source: Pluto texture from: https://snowfall-the-cat.deviantart.com/art/Pluto-Map-2015-Nov-10-546286799 - **Snowfall-The-Cat**

76. **Triton** – 2,706 kilometers: A moon of Neptune's which is believed to have originated in the Kuiper belt
    Source: Triton texture: http://www.johnstonsarchive.net/spaceart/cylmaps.html - page by Wm. Robert Johnston

77. **Europa** – 3,122 kilometers: Europa may contain an ocean with 2-3 times more water than all the water on Earth
    Source: Europa texture: http://www.johnstonsarchive.net/spaceart/cylmaps.html - page by Wm. Robert Johnston

78. **Moon** – 3474.2 kilometers: The Moon was formed after a planet called Thea collided with the Earth and a second smaller Earth Moon collided with it
    Source: Moon texture: https://www.solarsystemscope.com/textures - Solar System Scope

79. **Io** - 3,660 kilometers: A radioactive, volcanic world with over 400 active volcanoes erupting sulfurous compounds
    Source: Io texture: https://photojournal.jpl.nasa.gov/catalog/PIA00319 - NASA/JPL/USGS

80. **Australia** – 4,042 kilometers: Humans have inhabited Australia for as long as 65,000 years

Source: The image is from [1], specifically land_shallow_topo_east.tif, which was cropped at 5250x4320+13390+11880. - Reto Stöckl / NASA Goddard Space Flight Center

81. **USA** – 4313 kilometers: The first nation to land humans on the Moon
Source: https://commons.wikimedia.org/wiki/File:Blank_US_Map_(states_only).svg (Based on Electoral map.svg, inspired by BlankMap-World.png) - Theshibboleth

82. **Kepler-37b** – 4510 kilometers: The smallest exoplanet ever discovered
Source: Kepler-37b texture: https://www.solarsystemscope.com/textures - Solar System Scope

83. **Callisto** – 4821 kilometers: Valhalla, a 3,800-kilometer impact crater can be seen on Callisto
Source: Callisto texture: https://astrogeology.usgs.gov/search/map/Callisto/Voyager-Galileo/callisto_merc - USGS/USGS Astrogeology Science Center

84. **Mercury** – 4879 kilometers: The closest planet to the sun, it has the shortest orbital period of any planet in the solar system of just 88 days
Source: Mercury texture: https://www.solarsystemscope.com/textures - Solar System Scope

85. **Titan** – 5151 kilometers: In the Suns future red giant phase, Titan may become habitable for life to arise as the temperature increases
Source: https://www.nasa.gov/image-feature/jpl/pia12624/two-titans - NASA/JPL-Caltech/Space Science Institute

86. **Ganymede** – 5268 kilometers: An extremely thin atmosphere of oxygen is hypothesized to exist around this Jovian moon
Source: https://astrogeology.usgs.gov/search/map/Ganymede/Voyager-Galileo/Ganymede_Voyager_GalileoSSI_Global_ClrMosaic_1435m - USGS Astrogeology Science Center

87. **Mars** – 6779 kilometers: Contains Valles Marineris, a 4,000-kilometer-long, 7-kilometer-deep canyon
Source: Mars texture: https://www.solarsystemscope.com/textures - Solar System Scope

88. **IK Pegasi B** – 8,348.4 kilometers: A white dwarf which is the closest supernova candidate at 150 light years from Earth
Source: IK Pegasi B designed in After Effects

89. **Kepler-70b** – 9,671 kilometers: Its surface temperature is hotter than that of the Sun
Source: Kepler-70b designed in After Effects

90. **Venus** – 12,104 kilometers: Venus is the closest planet to Earth, reaching the closest distance at 41,000,000 kilometers.
    Source: Venus texture: https://www.solarsystemscope.com/textures - Solar System Scope

91. **Earth** – 12,742 kilometers: Earth was formed around 4.54 billion years ago
    Source: Tom Patterson, www.shadedrelief.com

92. **Kepler-10b** – 18,730 kilometers: The first terrestrial exoplanet discovered, it's dayside temperature is over 1,500 degrees.
    Source: Kepler-10b designed in After Effects

93. **Planet 9** – 19,000 kilometers: A hypothesized planet to explain the unexplained orbits of several trans-Neptunian objects
    Source: Planet 9 designed in After Effects

94. **Kepler-62e** – 20,514 kilometers: At 1,200 light years away, it may be an ocean planet or a mini Neptune
    Source: Kepler-62e designed in After Effects

95. **55-Cancri e** – 25,400 kilometers: It orbits its parent star in 2.8 days and has a daytime surface temperature of 2,300 degrees Celsius
    Source: 55-Cancri e designed in After Effects

96. **Kepler-22b** – 25993 kilometers: Over 2 times Earth radius, this planet may be an ocean world
    Source: Kepler-22b designed in After Effects

97. **Neptune** – 49,244 kilometers: It has an icy and rocky core and along with Uranus, it is considered an ice giant
    Source: Neptune texture: https://www.solarsystemscope.com/textures - Solar System Scope

98. **Uranus** – 51,118 kilometers: Hellish wind speeds of 900 km/h occur here
    Source: Uranus texture: https://www.solarsystemscope.com/textures - Solar System Scope

99. **EBLM J0555-57Ab** – 120,106 kilometers: With 85 times the mass of Jupiter, it is the smallest known star ever discovered
    Source: EBLM J0555-57Ab designed in After Effects

100. **Saturn** – 120,536 kilometers: Saturn's rings are made mostly of water ice and are up to a kilometer thick

Source: Saturn texture: https://www.solarsystemscope.com/textures - Solar System Scope

101. **Jupiter** – 142,984 kilometers: Contains the Great Red Spot, a storm larger than Earth which has been ongoing for 350 years
Source: Jupiter texture: https://www.solarsystemscope.com/textures - Solar System Scope

102. **TrES-2b** – 181,875 kilometers: This exoplanet absorbs more than 99% of light, making it the darkest known exoplanet
Source: TrES-2b designed in After Effects

103. **Luyten 726-8** – 194,796 kilometers: It is a flare star, which emit powerful solar flares very frequently
Source: Luyten 726-8 designed in After Effects

104. **HAT-P-32b** – 291,258 kilometers: Although weighing less than Jupiter, this exoplanet is still over two times as large
Source: HAT-P-32b designed in After Effects

105. **ROXs 42Bb** – 357,460 Kilometers: A hot Jupiter with 9 times Jupiter's mass and a temperature close to 2000K
Source: ROXs 42Bb designed in After Effects

106. **WR 102** – 542,646 kilometers: A Wolf-Rayet star with a surface temperature of 210,000K, it is set to explode in a supernova within the next 1,500 years
Source: WR 102 designed in After Effects

107. **Lacaille 9352** – 638,652 kilometers: A red dwarf with a temperature of 3,600K and relatively close by at 10.74 light years away
Source: Lacaille 9352 designed in After Effects

108. **HD 100546 B** – 986,589 kilometers: Likely a brown dwarf, it resides in a young solar system and a ring of dust
Source: HD 100546 B designed in After Effects

109. **The Sun** – 1,391,400 kilometers: A G-type star which has converted the equivalent mass of 100 Earths into energy
Source: The Sun designed in After Effects

110. **Alpha Centauri A** – 1,702,239 kilometers: It is a part of a triple star system, along with Alpha Centauri B and Proxima Centauri, a red dwarf
Source: Alpha Centauri A designed in After Effects

111. **KIC 8462852** - 2,198,412 kilometers: A star with unexplained dimming, dips up to 22% in brightness have been observed
Source: KIC 8462852 designed in After Effects

112. **V404 Cygni** – 8,348,400 kilometers: This star has a microquasar companion which is taking away mass from the star
Source: V404 Cygni designed in After Effects

113. **Achernar** – 15,861,960 kilometers: A highly distorted star due to its rapid spin
Source: Achernar designed in After Effects

114. **Melnick 34** – 27,828,000 kilometers: A 50,000K Wolf-Rayet star set to explode in a type 1c supernova before becoming a black hole
Source: Melnick 34 designed in After Effects

115. **Sagittarius A*** - 44,000,000 kilometers: The supermassive black hole that exists in the center of the Milky Way
Source: Sagittarius A* designed in After Effects

116. **R136a1** – 44,663,000 kilometers: Weighing at 350 times the mass of the sun, it is the most massive and luminous star known
Source: R136a1 designed in After Effects

117. **Polaris** – 52,177,500 kilometers: Polaris is the star that lies almost in the center of the north celestial pole
Source: Polaris designed in After Effects

118. **Canopus** – 98,789,400 kilometers: The second brightest star in the night sky, after Sirius
Source: Canopus designed in After Effects

119. **Peony star** – 128,008,800 kilometers: A Wolf-Rayet star lying in the Peony Nebula, it is set to explode in a supernova within a few million years
Source: Peony Star designed in After Effects

120. **J1407b** – 180,000,000 kilometers: A possible gigantic ring system exists around the object orbiting the star J1407
Source:

121. **The Pistol Star** – 425,768,400 kilometers: The strength of this star's stellar wind is 10 billion times more powerful than our suns stellar wind
Source: The Pistol Star designed in After Effects

122. **Chi Cygni** – 484,207,000 kilometers: Despite this star being over 6,000 times brighter than the Sun, it less than half as hot
Source: Chi Cygni designed in After Effects

123. **R Doradus** – 514,818,000 kilometers: From the perspective of Earth, it is the star with the largest apparent size
Source: R Doradus designed in After Effects

124. **119 Tauri (Ruby star)** – 836,231,400 kilometers: One of the reddest stars visible in the night sky
Source: 119 Tauri (Ruby Star) designed in After Effects

125. **CW Leonis** – 1,061,638,200 kilometers: It is surrounded by a thick dust environment and its atmosphere contains water
Source: CW Leonis designed in After Effects

126. **IRC+10420** – 1,181,994,300 kilometers: It is a yellow hypergiant, an extremely rare class of stars with only 15 known in the galaxy
Source: IRC+10420 designed in After Effects

127. **NR Vulpeculae** – 1,363,572,000 kilometers: This star can be found in the constellation Vulpecula, it is a red supergiant
Source: NR Vulpeculae designed in After Effects

128. **VY Canis Majoris** – 1,975,788,000 kilometers: VY Canis Majoris may evolve into a yellow hypergiant, then a blue variable and finally a Wolf-Rayet star
Source: VY Canis Majoris designed in After Effects

129. **RW Cephei** – 2,135,799,000 kilometers: An orange hypergiant, if placed in our solar system it would be larger than Jupiter's orbit
Source: RW Cephei designed in After Effects

130. **UY Scuti** – 2,376,511,200 kilometers: The largest known star, eight hours would be needed to complete one orbit of UY Scuti at the speed of light
Source: UY Scuti designed in After Effects

131. **Quasi-star** – 10,000,000,000 kilometers: A hypothetical type of star that existed in the early universe with a black hole at the core
Source: Quasi Star designed in After Effects

132. **NGC 1277** – 29,600,000,000 kilometers: A supermassive black hole with 14% of the galaxies mass
Source: NGC 1277 designed in After Effects

133. **Phoenix Cluster black hole** – 118,000,000,000 kilometers: This supermassive black hole is growing heavier at a rate of 60 solar masses per year
Source: Phoenix Cluster black hole designed in After Effects

134. **S5 0014+81** – 236,700,000,000 kilometers: A blazar with a supermassive black hole 40 times the size of Pluto's orbit
Source: S5 0014+81 designed in After Effects

135. **TON 618** – 384,000,000,000 kilometers: A hyper luminous quasar and one of the brightest objects in the universe
Source: TON 618 designed in After Effects

136. **Eskimo nebula** – 0.68 light years: A planetary nebula with two shells made from the inner stars stellar winds blowing out gas
Source: https://commons.wikimedia.org/wiki/File:NGC2392_Eskimo_Planetary_Nebula_from_the_Mount_Lemmon_SkyCenter_Schulman_Telescope_courtesy_Adam_Block.jpg - Adam Block/Mount Lemmon SkyCenter/University of Arizona; Ngc1535

137. **Oort cloud** – 3.2 light years: A spherical region of icy bodies bound loosely by the gravity of the Sun
Source: Oort Cloud designed in After Effects

138. **Helix nebula** – 5.74 light years: A 10,600-year-old nebula with a central star losing its outer layers to form the nebula
Source: https://www.nasa.gov/mission_pages/spitzer/multimedia/pia09178.html - NASA/JPL-Caltech/Univ.of Ariz.

139. **Crab nebula** – 11 light years: The nebula and pulsar in the middle were formed following a supernova in AD 1054

- Source: http://sscws1.ipac.caltech.edu/Imagegallery/image.php?image_name=sig05-003 (https://commons.wikimedia.org/wiki/File:Spitzer_Crab_Nebula.jpg) - NASA/JPL-Caltech/M.LN. Ashby (Harvard-Smithsonian CfA)

140. **Mira** – 13 light years: This star is losing enough mass to form an enormous tail behind it
Source: http://www.galex.caltech.edu/media/glx2007-04r_img01.html - NASA

141. **Omega Nebula** - 22 light years: Among the brightest star forming regions with a mass of 800 Suns
Source: https://commons.wikimedia.org/wiki/File:Omega_Nebula_M17.jpg - Chuck Ayoub

142. **Cygnus loop** - 90 light years: A supernova remnant which is a powerful emitter of soft X-rays
Source: http://www.nasa.gov/mission_pages/galex/pia15415.html; see also http://www.nasa.gov/multimedia/imagegallery/image_feature_2205.html and https://photojournal.jpl.nasa.gov/catalog/PIA15415 - NASA/JPL-Caltech

143. **Rosette Nebula** - 130 light years: A H II region with extremely high temperature regions of plasma up to 10 million K
Source: https://commons.wikimedia.org/wiki/File:Rosette-Nebula-CPA.jpg - Chuck Ayoub

144. **RCW 49** - 350 light years: A H II region with over 300 newly formed stars
Source: http://www.spitzer.caltech.edu/images/2058-sig08-018-2-Channel-RCW-49 - NASA/JPL-Caltech/E. Churchwell (University of Wisconsin - Madison)

145. **Carina Nebula** - 460 light years: A giant nebula with several smaller nebula and supergiant stars contained within it
Source: https://commons.wikimedia.org/wiki/File:Nebulosa_de_Eta_Carinae_o_NGC_3372.jpg - Fedaro (Fernando da Rosa) y Santiago Roland

146. **Gum Nebula** – 1,100 light years: Thought to be the remnant of a million-year-old supernova explosion
Source: https://commons.wikimedia.org/wiki/File:GumNebula.png - Roberto Mura

147. **Sextans A** – 5,000 light years: A dwarf galaxy, it underwent a massive expanding wave of star formation 100 million years ago
Source: https://apod.nasa.gov/apod/ap981103.html - S. D. Van Dyk (IPAC /Caltech) et al., KPNO 2.1-m Telescope, NOAO

148. **Large Magellanic Cloud** – 14,000 light years: A dwarf galaxy satellite of our own galaxy, it may be gravitationally bound to the Small Magellanic Cloud
Source: https://commons.wikimedia.org/wiki/File:Nube_Mayor_de_Magallanes..JPG - Gonzalo Vicino

149. **Whirlpool Galaxy** – 60,000 light years: A grand design spiral galaxy with a mass of 160 billion Suns
Source: https://www.flickr.com/photos/133259498@N05/26568428543/ - **Giuseppe Donatiello**

150. **Milky Way Galaxy** – 100,000 light years: The solar system orbits the Milky Way once every 240 million years

Source: Milky_Way_2005.jpg (https://commons.wikimedia.org/wiki/File:Milky_Way_2010.jpg) - Milky_Way_2005.jpg: R. Hurt; derivative work: **Roberto Segnali all'Indiano**

151. **Pinwheel galaxy** – 170,000 light years: This galaxy has been identified to have over 1,264 star forming H II regions, a very high amount
Source: http://www.spitzer.caltech.edu/Media/releases/ssc2008-14/ssc2008-14b.shtml (https://commons.wikimedia.org/wiki/File:Ssc2008-14b.jpg) - Karl D. Gordon (STScI) Charles W. Engelbracht (University of Arizona) George H. Rieke (University of Arizona) K. A. Misselt (University of Arizona) J.-D. T. Smith (University of Arizona) Robert C. Kennicutt Jr. (University of Cambridge)

152. **Andromeda Galaxy** – 220,000 light years: Andromeda is hurtling towards our galaxy at 110 km/s, it will collide in around 4 billion years' time
Source: https://commons.wikimedia.org/wiki/File:The_Andromeda_Galaxy.jpg - Ivan Bok

153. **UGC 2885** – 832,000 light years: This giant spiral galaxy has been disrupted by gravitational disturbances from other neighboring galaxies
Source: http://aladin.u-strasbg.fr/AladinLite/?target=ugc%202885&fov=0.13&survey=P%2FDSS2%2Fblue - Aladin skypots at SIMABD - Digitized Sky Survey - STScI/NASA, Healpixed by CDS

154. **NGC 262** – 1,300,000 light years: This spiral galaxy is estimated to hold 15 trillion stars
Source: http://skyserver.sdss.org/dr14/en/tools/chart/navi.aspx (https://commons.wikimedia.org/wiki/File:NGC262_-_SDSS_DR14.png) - Sloan Digital Sky Survey

155. **IC 1101** – 2,100,000 light years: Among the largest galaxies every discovered
Source: http://skyserver.sdss.org/dr14/en/tools/chart/navi.aspx (https://commons.wikimedia.org/wiki/File:NGC533_-_SDSS_DR14.png) - Sloan Digital Sky Survey

156. **The Local Group** – 10,000,000 light years: Contains 54 gravitationally bound galaxies including our own
Source: https://commons.wikimedia.org/wiki/File:5_Local_Galactic_Group_(ELitU).png - Andrew Z. Colvin

157. **Virgo Supercluster** – 110,000,000 light years: Contains over 100 galaxy groups including the local group
Source: https://commons.wikimedia.org/wiki/File:6_Virgo_Supercluster_(blank).png - Andrew Z. Colvin

158. **Boötes void** – 330,000,000 light years: An extremely empty region of space with about 1 galaxy per 10 million light years
Source: https://commons.wikimedia.org/wiki/File:7_Local_Superclusters.png - Andrew Z. Colvin

159. **Laniakea Supercluster** – 520,000,000 light years: All 100,000 galaxies within this supercluster are moving towards the Great Attractor
Source: http://www.nature.com/nature/journal/v513/n7516/full/nature13674.html - Brent R. Tully et. al.

160. **Pisces-Cetus Supercluster Complex** – 1,000,000,000 light years: A galaxy filament containing five parts, including the Laniakea Supercluster
Source: https://apod.nasa.gov/apod/ap071107.html - W. Schaap (Kapteyn Institute, U. Groningen) et al., 2dF Galaxy Redshift Survey

161. **Giant Void** – 1,300,000,000 light years: A gigantic void with just 17 galaxy clusters within it that cannot interact with each other
Source: https://commons.wikimedia.org/wiki/File:7_Local_Superclusters.png - Andrew Z. Colvin

162. **Sloan great wall** – 1,380,000,000 light years: A colossal wall of galaxies located 1 billion light years away
Source: https://apod.nasa.gov/apod/ap071107.html - W. Schaap (Kapteyn Institute, U. Groningen) et al., 2dF Galaxy Redshift Survey

163. **KBC Void** – 2,000,000,000 light years: The largest super void ever discovered, the Milky Way is roughly close to its center
Source: https://commons.wikimedia.org/wiki/File:7_Local_Superclusters.png - Andrew Z. Colvin

164. **Huge Large Quasar Group** – 4,000,000,000 light years: A gigantic group of 73 quasars
Source: A combination of two images:
The Antlia Galaxy Cluster:

Suggestions (Some of them):

alıza ๑

I would love to see a Size comparison of the universe 2018 :3

Maus

Put them all together on 1 picture (next to each other) to really see how massive it is. By just flashing it by we can't really understand how MASSIVE this is

Santiago Pires

Probably the smallest and largest of every particle, planet, star, black hole, galaxy

AshleeDoesGaming

PLEASE make one for 2018!

Aaron West

Yes! I loved this video. please make another.

Grimalackt

Do the same type of transition, would like to see the smallest of each category (planet star black hole etc.) but otherwise, the same thing

Carly Galloway

Times Infinity you should make a 2nd version 2017 universe size comparison because you skipped to much, here is what you missed

Planck length, neutrino, neutron, fuck atom, hydrogen atom, sponge atom, tissue atom, paper atom, water molecule, dog mite, virolla mite, honey bee, bumble bee, 2015 2542 Pluto 6 (tissues), 2016 2543 Pluto 7 (cherries), daisy, rosie, Caillou, giant tortoise, lion, bear, sloth, Doris, Boris, 1991 ba, the machine from Mr. Peabody and Sherman aegeaon, 4672 ndf, 4622 toto, Jupiter ill, Deimos, photos, Lichtenstein, Malta, 5633u ghx, south Carolina, hydra, Antarctica, Dione, rhea, Titania, Kepler 22-c, dream island, Asia, Russia, United nations, North America, Africa, Greenland, Proxima Centuri b, planet nine, gliese 459, Proxima Centuri a, Pollux b, HD 10004663 b, alpha Centuri b, Sirius a, vegan, Pollux, Arcturus, the laughter star, pony nebula, di*k nebula, orbit of Sedna

Alex The Shark Boi

Guys I am feeling so small😮

Trygve K

Try to include the strangest anomalies out there just to baffle the viewers completely. Try making objects of vast size easier to imagine by using other comparisons.

Yeah you're gonna sound stupid in a few moments

You should definitely make a 2018 one

whydoiexist 359

Times Infinity I'm Your First Like!

Andrew Unitas

Times Infinity ii

Trygve K

Include a hydrothermal worm, too.

Xur Gaming

Hello Times Infinity, I have a suggestion. Could you try size comparison of something other than the Universe? Like technology, building, etc.? Thanks!

TheCheeseMan 06

Make more comparisons, like for example the sun is blah blah blah times larger than the earth

Ryan Michaels

Done Differently and Add Some Music like Ride on - Celtic Panpipes. Trust me, your videos would be perfect.

Mark Beiser

Needs a fairy cake and a new title. ;)

Cactus Club

The biggest of each thing, like black hole, galaxy, star

Easily Forgettable

Hey there, I've been watching all the size comparison videos you've made and I'm a huge fan. I'm a complete astronomy nerd myself and I totally want to see more things that are set to explode or collide in our universe. I love the destructive side of space more and I was blown away when you said there was another object colliding into our galaxy and another star set to supernova.

Baltorusite Mapping

You should probably do a more slightly longer version of this since I like watching something like this and the longer the more facts I can see or maybe effects. Maybe an extra two minutes than this? Or something a bit more ambitious, 20?

More exoplanets would be nice additions and more animals as well. Also, Mimas, pls

RyCitrus

Add: Makemake, Ceres, and some more dwarfs. 55-cancri-e, H1407b, and the theorized scale for Planet 9.

There's no mistakes or nothing I noticed that was flawed. Everything is wonderfully executed :)

whydoiexist 359

Times Infinity add the White Dwarfs, Dwarf Planets, and Supernovas and even the Dwarf Stars.

Samuriwarrior3

Put the average car and house in next video.

Chip

Times Infinity Error - Andromeda isn't the closest galaxy to the Milky Way. It's the closest major one. Might be worth amending it

Nitinder_J

Times Infinity do a 2018 :D

Brenden Sannar

Make it much longer

Zepto Lemon

Times Infinity I always watch this video for some reason. But this video is awesome!

RarerAJ

I love the video. I would love a 2018 version. I'd say check your spelling. In this version, you had a spelling error at 8:54, but otherwise it's perfect.

Sylraxi

More of the "X amount of X could fit inside X"

RarerAJ

It said yellow giant even though it was hypergiant. Not a big problem, but I'd say check for errors like that before you post it. :)

witherboss398

Ohh... A 2018 version will be great! :-D

Christa Anderson

Size comparison 2018 needs NR Vulpeculae after UY Scuti, despite the fact it was recently discovered.

Preston Garvey

Please continue making these kind of videos, maybe a separate video on black holes and space theories such as the multiverse?

Love the content!

Warbrick Studios

I'd like to see some more exoplanets, if possible.

witherboss398

You also missed Mount Everest. Plz make size comparison 2018! :)

Pc Stuff

What about bosons and in fact if you can for universe size comparison 2018 how about everything on the whole damn standard model

Team DAVIS 23 o

ADD THE SONG STICK TALK IN THE 2018 VERSION THATS A MUST

KCalcitonin PolyPeptHide

I want to see a square root pi... You didn't say it had to be a rational suggestion...

Preston Garvey

No, the songs are perfect. It's one of the reasons the video is so good.

Kithro Games

What about the Omniverse

The Muslim Dude

+Times Infinity, pictures are cool, but maybe you can find 3D models for some of these and show them instead of a static image in comparison. Just a suggestion, but even if you make the same video with some modification it would still be awesome. May God have mercy on your soul.

Warbrick Studios

You should add more moons like Enceladus, Tethys, Oberon, Umbriel, etc. and more exoplanets like Kepler 186f, Kepler 22b, Proxima b, Gliese 581g and more stars like Alpha Centauri B, Betelgeuse, and more red dwarf stars if possible.

Devesh Singh

Times Infinity try the Crysis 2 theme song.

ii_Delta_ii YT

Maybe add the diameter of the solar system

RarerAJ

Times Infinity also I would like to say I love that the space objects you put in the video, like, move. I wish I could make videos like that.

TotallySolar

Add countries to the comparison along with buildings :) #TimesInfinity

Blackhole S5 001481

Times Infinity same songs more stuff ok

Vegito

Times Infinity Please, I beg you make another version of this!

Alex The Shark Boi

Times Infinity if u can pls put the new things discovered and the older ones

KCalcitonin PolyPeptHide

Since infinity is the concept in math that you can always add one, and you propose to multiply "infinity" which isn’t any factorial, being that it has no beginning or end. does that mean you're always going to be what you started off with since the multiplication of 1 is what that suggests? (I’m not a troll, I’m from the time online when trolls didn’t even exist. And we had newsgroups, and learning enough from one another to not be intimidated/insecure by thinking "omg, they are using smarts and questioning me, attack”)

I do appreciate the screenname though, it’s very thought provoking. Thank you.

LarzeePants

Times Infinity please change your song tastes (no offense) the music creeped me out when it goes BUMM BUMM BUMM and it scares the heck outta me

Fak01

Times Infinity your collaborator is my friend!!🤘

time for crusades

Times Infinity lovely, just a little too fast. somehow would love to see the earth and all that follows on the same screen as a visual reference. but this video kind of really makes me feel depressed that in my lifetime I will never understand and be able to even imagine this clearly. great job

Lurkey the Turkey

Times Infinity Add rotifers. If you don't know what it is, it's the smallest animal that we know of.

KCalcitonin PolyPeptHide

You mean smallest Eukaryote. Not smallest Fauna....

Gabrielius Mištautas

Add the newest information scientists made in 2017 and don't make big jumps in sizes :)

Lordscale's777 the vanquisher

Times Infinity the Hyperverse, quantum verse, higher dimensions, then on to mythological things like the tree from Norse mythology that holds the nine realms, then all creation

1dekidejo

so what galaxy is closer

1dekidejo

well I know what you ment but that is not a speling eror, my coment is a big spelling eror

Danylo Feschowetz

Please use >Next Step (Orchestral)< from FintsticOfficial in your next Space Size Comparison video!!!!

Andromeda

Hmm, I'm pretty sure you want to keep it short and simple, but if you could put more information about everything, that'd be nice, not that I don't like there's not THAT much information, just makes the video feel longer.

Alex The Shark Boi

Times Infinity that BIG stars are sometimes light blue like the Pistol Star, so u must make UY Scuti blue like Pistol Star

Alex The Shark Boi

Times Infinity btw make a 2018-star size comparation ;)

Alex The Shark Boi

ProCougar YT btw largest nebula ever is two colons of universe

Mauritz van lingen

Times Infinity use the music of 2015, I love the vibe it gave

Edward Levy

Times Infinity more exoplanets and galaxies, less bananas, and emus. Thanks!

KCalcitonin PolyPeptHide

Hey now, the Cavendish is in danger of being extinct, I say, go bananas... (you could include the fungi that threatens their existence, to satisfy the Bananarama Panoramic view. and play 80's music so I don't feel like it's the last hours of a Rave and everyone is exhausted and need a "torch song" to feel the edge wear off...

The universe is a university. and a lot of school movies were made in the 80's... just saying.... a serious undertone to something that is serious, can also have a negative impact to those who aren't optimistic and, ya know, I'm always happy being a pessimist, cuz I'm either not disappointed or unprepared, and at best, it's never as bad as I thought it would be. it's a better option than momentary dopamine levels rising past the point of being able to do much other than complain it wasn't good enough, or simply just be right and not disappointed....

I say this since the universe's dynamics, often have me think "our universe probably looks similar to what atoms /etc. might be representing in a macro universe, but whatever the case, NO role or position in this death/life design is one I want to have or maintain if I had a choice, and find the system of change to be that of death more than life... (blame working in healthcare for nearly 10yrs for my non-nihilistic yet, as well as my concrete prognosis is that to live is vile and evil ..

Gabethegamer911

Yes plz

Abstract Delta

Times Infinity I

Kennady Boone

Times Infinity one thing we could do is call "el Capitan" it's true name which is Guadalupe peak. El Capitan in the small one

Brenden Sannar

Times Infinity Make the 2018 one much longer please!!

Also, make a Patreon page so I can support you!!

Andromeda

Rewards for donating?

... Dude you already make great content, so I would basically just donate to be nice, and just say how much I love your content.

Alex The Shark Boi

Times Infinity 😊 hope they will be ready for 2018 year also don't forget to put that music from the end it was pretty good

Rodney Munch

I'd like to see a white dwarf or two in there, you have a couple of neutron stars but no white dwarf. Oh, and a stellar black hole to go along with the supermassive ones would also be nice. Love the video by the way, have watched it several times and enjoy it every time!

Alex The Shark Boi

Rodney Munch but largest black hole has been put also

Rodney Munch

That's what I'm saying Alex, would be nice to have some stellar black holes and perhaps even some intermediate mass ones to go along with the supermassive ones to show the variety in sizes they come in.

Olivier Morneau

I think your videos are amazing. I would like to see 1 AU and other more abstract concepts, such as the light-year, parsec, and such. Size comparison towards the end could include the percentage of the observable universe which exists due to inflation shortly following the Big Bang. Just my two cents, but amazing work, and keep it up! :)

Егорка Боберка

Tsunami and other disaster size!

Егорка Боберка

Btw they are really sized to it.

Shann Varly Babor

Times Infinity you are so good at this! next year 2018 could you pls create this again and with the UNIVERSE and (if you fold a paper 100 u could)

Olivier Morneau

Do you mean the whole universe or the observable universe? Because as far as I know, the whole universe, or what lies beyond our cosmological horizon, is unobservable and therefore seems immeasurable. Furthermore, measuring the curvature of space (or lack thereof) requires a precision much too great for our little patch of space, at least for today's technology.

Alex The Shark Boi

Olivier Morneau I meant in the observable universe not in all

Alex The Shark Boi

Rodney Munch quasars too maybe it would be cool tho

TheEpicDestroyerX

Times Infinity yes, we don't everything yet

Anna Wing

I want to see how big the Kuiper Belt is!

Gaming girl

Times Infinity OK here it is: (same thing in the start) Key, Dollar (US), Average size of a shoe, Composition notebook, Portuguese man of war, Floor lamp, Average living room size, Average Mountain size, Mount Everest, Earth, Sun, (and more you can add because it'll be a good list)

Gaming girl

Times Infinity That’s what you’re going to add it’s only a request....

Seminix Mate

You kept saying THE solar system like there’s only 1

JdubPierce

If possible, try and add more black holes, there were only 4 in this video and it would be cool to see more. And, in other size comparison videos, usually the stars, Arcturus, and Betelgeuse are in those videos, I saw Betelgeuse in the 2016 video, but it wasn't in this video. Take these ideas into consideration but it's not the biggest necessity.

Γιαννης Καραγκιοζιδης

Times Infinity amazing video bro!!

Cristian Popa

Times Infinity you can include more quasars, cause I just FRICKIN' LOVE THOSE STARS!

Luka Gosić

Times Infinity use white background

_ x[JBØY]x _

Have the supercluster structures animated with big and lighting effects

Nowin

Better transitions in music please. The pauses are awkward.

DevPlayz

Times Infinity the newest record breaking star of mass

De Derpy Boys

1 error, you could Use a theory, I don’t know anymore How its named, but if that theory is true, the universe is 165 SEXTILLION TIMES LARGER THAN THE OBSERVABLE UNIVERSE. HOLY ****.

Kim Land

Without reading the 109 comments. Please introduce the Cosmos taking in all the multiverse. Also, I found it a bit difficult to constantly see the difference in size, I prefer everything centralized. I feel the best YouTube vid on size of everything was that vid with the circles around it zooming out, if you could somehow do something similar (flying through space or something) that would be better. I feel 'size of the cosmos' type vids should excel in brilliance, they should be correct, innovative and all inspiring. I agree you should leave the reverse part at the end in as well Maybe you could have the microscopic things on a human body and keep moving out. ok that's all :) Let me know ;)

Ras This

@Times Infinity Perhaps you could add in several countries like China, Russia etc. I'd also like to see more exoplanets, black holes, buildings. Stuff like that.

Pokemon X Science - Gameplay - Theories.

Times Infinity do it differently I didn’t understand the sizes

James Pitt

Alex The Shark Boi we all are nothing.

Samiester999poor GamesForDayz

Times Infinity nice vid

Ryan Budge

Times Infinity please do another one of these I remember watching the 2016 one for the first time and I was so excited when I saw this one come out I would love it if you could do another

Luis Marcus Apo

alıza ๑ me too :3

Viktor SMG

Times Infinity add the exoplanet named HD 106906 b it's huge

Adrian Zaragoza

Times Infinity where's titanic

Random Channel

Times Infinity OMG LEET 13:37

Bartosz Kaczmarek

In S.C.U. 2018 I would like to see just more celestial objects (moons, planets, stars (neutron stars, white dwarfs, black holes, Wolf-Rayet stars), star clusters, nebulae, galaxies, galaxy clusters etc.) and more atoms (hydrogen, helium, oxygen, gold etc.). Anyway every S.C.U. is very good.

Epicdudethe999th Reborn

The size of the least dense object taking up the size of a plank length compressed into its swartzchid radius

D T

I'd say try showing the proportionality of each object in terms of the previous object, e.g. how many Andromedas would fit in Malin 1

Ma5cu5

You could show us some more atoms ore quarks and taus and bosons and so on.

Ma5cu5

And you could cut away the backgrounds of some stuff! Like the Burj Khalifa background and the mount Everest and Olympus mons backgrounds if possible! :)

Ma5cu5

Oh! You should feature the theoretical Planet 9 that scientist's think is in our solar system!

Typhoon YT

Times Infinity oh my god did you forget Phobos so mean one of mars moons

Typhoon YT

Times Infinity and you forgot gargantua

ASVP 333

I guess you should focus more on adding more stars and other star types and mention their size, mass and the distance between them and Earth. A 3d video would be amazing too.

No one Here

Times Infinity Change the units of measurement from something like "1.2 x 10^-7 meters" to smaller metric units like nanometers and micrometers.

Ma5cu5

Well you could keep the mathematical small numbers like the size of an atom and add like nanometers. E.g. Planck Particle A tiny black hole 1.14 x 10 to the power of -34 meters / 1 attometer.

Just Chillin

Times Infinity d, would love to see the star mira and its long tail in a vid :)

JoshtheBossXXL 9

Maybe a few of the Game maps such as Minecraft or No man's sky

Mjswag756

Maybe a size comparison of fictional characters

the io gamer

Maybe the upper size limit of a quark simplified

Keaton Moore

Times Infinity More Exoplanets please!

xavi 200

I would like to see Even the Omniverse and the Infinity
